

Industry	n (corps)	$\hat{\beta}$, gross	$\hat{\beta}$, net	$\Delta\hat{\beta}$
331	104	0.321	0.324	0.003
322	113	0.347	0.335	-0.012
369	391	0.248	0.244	-0.004
313	699	0.289	0.287	-0.003
321	524	0.390	0.385	-0.005

Gross: baseline first stage, $\ln(M_{it}^*/(P_t Y_{it}))$. Net: same estimator, materials share netted of sales taxes on both sides, $\ln((M_{it}^* - t_{2,it})/(P_t Y_{it} - t_{1,it}))$, $t_1 = \tau_S \cdot \text{sales}$, $t_2 = \tau_P \cdot M^*$. Both run on the common sample where both shares are defined. $\Delta\hat{\beta}$ is small relative to $\hat{\beta}$'s own scale in all five industries.
