All columns use the single-tax (nominal log share) first stage; $\hat{\beta}$ is the corporations' first-stage estimate, common to the three evasion-corrected columns. m_{it-1}^* and $\tilde{\mathcal{W}}_{it-2}$: one instrument each, point estimates by GMM; below them, the projections of the 95% test-inversion regions for (α_K, α_L) : sharp (χ_2^2 , credit for profiling γ_0, γ_1) and conservative (χ_4^2). Joint efficient GMM: both instruments together; point estimate at the grid minimum; sharp (χ_3^2) and conservative (χ_5^2) regions. Industry 313's joint sharp region is empty (min $J = 9.74 > 7.81$). In 313, the $\tilde{\mathcal{W}}_{it-2}$ estimate of α_K is at the bound (0) and outside its own sharp region. GNR and OLS: uncorrected estimates.
