Industry	Corporations	Two-tax (net share)	Single-tax (gross share)	Difference
321	524	0.385	0.390	0.005
322	113	0.335	0.347	0.012
324	59	0.412	0.430	0.018
342	256	0.333	0.343	0.010
369	391	0.244	0.248	0.004

Output elasticity of materials, $\hat{\beta} = \exp(\mathbb{E}[s_{it} \mid \text{corporation}])$. Two-tax: log materials share net of sales taxes, $s_{it} = \ln[(\rho_t M_{it} - t_{2,it})/(P_t Y_{it} - t_{1,it})]$, the headline (Chapter 2). Single-tax: the gross share $\ln(\rho_t M_{it}/P_t Y_{it})$. Same corporations (corporate firm-years in the production sample); difference = single-tax minus two-tax. Industries: the five of Chapters 5 and 6.
