Evasion-corrected: $\hat{\beta}$ is the corporations' first-stage estimate (log materials share net of sales taxes); below it, its 95% test-inversion regions from the corporations' share moment: sharp (χ^2_1) and conservative (χ^2_5). Point estimates of (α_K, α_L): the minimum of the test-inversion statistic, with the covariance of the moments re-estimated at each candidate, the statistic whose regions are shown. Instrument $\tilde{\mathcal{W}}_{it-2}$ (exactly identified); below the estimates, the projections of the 95% test-inversion regions for (α_K, α_L) (0.005 grid over $[0,1]^2$): sharp (χ^2_2) and conservative (χ^2_4). GNR and OLS: uncorrected estimates on the same sample (GNR's share regression on the log materials share net of sales taxes). Other instruments: Appendix E. (· or ·): the bound of the parameter space (0 or 1) is not rejected. Industries: the five largest, by share of output, where overreporting is detected at the 1% level and the variance of the unincorporated firms' residual is at least the corporations' (the condition the deconvolution requires; Beverages, 313, fails it) (all nine in Appendix E).
