Interior firms in the nine industries where the test rejects, top 0.5% by M^* trimmed. Detection $q = (\lambda_{0,jt}e)^{\lambda_1}$, $\lambda_{0,jt} = 1/(\bar{\lambda}\bar{M}_{j,t-1})$, with $(\lambda_1, \bar{\lambda})$ fixed at the operating point; R = draws per firm. Directions kept = eigenvalues of $\hat{\Omega}$ retained in the objective.
