

	Estimate	95% set	$TS_{\min}$
Loss per firm-year, interior firms (real pesos)	72	[43, 109]	20.2
Loss / gross sales-tax revenue: interior firms	4.7%	[2.8%, 7.1%]	20.2
(A) evader industries	4.1%	[2.8%, 5.5%]	20.6
(B) all firms	1.5%	[1.1%, 3.1%]	18.9

Current rates. Loss $L = \tau_P(1 - q(e))e$: the credit paid on undetected overreporting, estimated with its own moment. Interior firms: ELVIS sample, mean gross sales-tax revenue 1,547 real pesos per firm-year. (A) adds the trimmed firms' gross sales-tax revenue and (B) every other firm's; their loss is set to zero, so (A) and (B) are lower bounds. Each set is the union of the values accepted over several solver runs. Conservative test, $TS \leq \chi^2_{18,.95} = 28.87$.
