

	Estimate	95% set	$TS_{\min}$
True credits, $E[\tau_P M]$	1,880	[1,645, 2,101]	23.7
Potential revenue, $E[P]$	-333	[-554, -98]	23.7
Increase in net refunds, $L/ P $	0.216	[0.136, 0.479]	23.7

ELVIS interior firms, real pesos per firm-year, current rates. $L = \tau_P (1 - q(e))e$; $P = t1/p_{gdP} - \tau_P M$; $R = P - L$. The $E[P]$ set follows from the $E[\tau_P M]$ set because $t1$ is observed (mean 1,547). Conservative test, $TS \leq \chi^2_{18,.95} = 28.86$.
