

CV-adjusted R, conservative test (Theorem F.1) – all 15 . points, fully bisected

Blue = passes at 95% ($\hat{\tau} = 18.3$); gray $\times$ = rejected. Gray band = $\tau = 0$'s own passing interval, for visual reference.

$\tau = -8\%$ is the smallest tax cut statistically distinguishable from $\tau = 0$. Cuts of -1% to -7% still overlap the $\tau = 0$ band; increases ($\geq +0.5\%$) separate cleanly.
