

Industry	m_{it-1}^*			$\tilde{\mathcal{W}}_{it-2}$		
	Mean	SD	Skewness	Mean	SD	Skewness
331 Wood products	4.02	0.25	-0.72	4.48	0.26	-0.19
322 Wearing apparel	4.09	0.29	-0.46	3.95	0.28	-0.50
369 Non-metallic minerals	2.69	0.28	-0.47	2.90	0.28	-0.78
313 Beverages	3.73	0.44	-0.09	8.22	0.90	-0.50
321 Textiles	2.79	0.39	-0.20	2.79	0.38	-0.15

Moments of the deconvolved density of productivity ω_{it} (all firms), from $\tilde{\mathcal{W}}_{it} = \omega_{it} + (1 - \beta)\varepsilon_{it}$ with β and (α_K, α_L) from the corresponding single-instrument estimates in the production function table. Penalized B-spline (logspline) deconvolution; the density of ε is a kernel estimate from corporations' residuals. The level of ω depends on (α_K, α_L) , so means are comparable within a column, not across instruments.
