	GNR	21.0	11.2	18.7	1.84	2.18	3.47	5.58	-0.39	0.89

Productivity in levels, $\exp(\omega_{it})$; percentile ratios as in Gandhi, Navarro and Rivers (2020, Table 3); skewness of ω_{it} ; $\hat{\gamma}_1$: persistence, the AR(1) coefficient of ω_{it} (corrected: IV estimate within the production function step; GNR: OLS on firm-level ω_{it}). Corrected: moments of the deconvolved density of ω (penalized B-spline deconvolution of $\tilde{\mathcal{W}}_{it} = \omega_{it} + (1 - \beta)\varepsilon_{it}$), with the production function estimates of the corresponding single instrument. GNR: firm-level ω_{it} from the uncorrected GNR (2020) Cobb-Douglas estimation, with the measurement error removed. Both exclude ε . Industries: 331 wood products, 322 wearing apparel, 369 non-metallic minerals, 313 beverages, 321 textiles. In 313, the $\tilde{\mathcal{W}}_{it-2}$ estimate of α_K is 0 (at the bound), so its ω absorbs capital and its level is not comparable.
