

Claims (raw, no control variate), conservative test (Theorem F.1) – 9 tested . points

Red = passes at 95% ($\sigma^2=18.3$); grey $\times$ = rejected. Grey band = $\sigma=0$'s own passing interval, for visual reference.

Claims_i(.) = $\dots_i[M_i + (1 - q(e'_i))e'_i]$: deduction claims, legitimate plus undetected overreporting.
Excludes sales-tax revenue on sales, which has no evasion response.
